as with the cattle industry, is a covert cause for personal attacks on other grounds.

A third enterprise, trucking, has caused a realignment of political interests in factions associated with two truck-owning cooperatives. Membership in one of the cooperatives, or patronage of one of the two trucks, arouses the enmity of members of the other cooperative. Several threats have been made on the lives of the owners and the operators, but the only damage done has been to tires.

The tensions resulting from the introduction of these new enterprises cannot be fully measured by the deaths attributed to direct economic conflict. Wealth differences resulting from the new enterprises excite envy, and with it come accusations of witchcraft. In this community, witchcraft killing does not perform the normative function of reducing wealth differentiation that Kluckhohn saw operating among the Navaho (1944), since it is the poor man who is killed as a witch, not the rich man. The slaying of the envious witch exacerbates the economic differentiation that provides the seedbed for conflict.

Another new source of tension is found in the growing demand for political leadership or even independence from the township by the *ejido* colonies formed since land reform went into effect in 1937. The inept maneuvers of two founders of the ejido colonies in hot country resulted in two homicides (cases 12 and 18 in Table 1).[9] The increasing strength of these hamlets will mean that more attempts will be made in the future to gain political equality and/or independence. Whether this will result in increasing homicides will depend on social-control agencies external to the Indian communities.

Homicide occurring as a direct result of economic and political competition represents a new strategy in the community. The decision to kill rather than to use other negative sanctions is related to the social-control mechanisms discussed below.

Changing Mechanisms of Social Control

A system of social control rests not only on the exercise of negative sanctions, but on the sense of personal security derived from confidence in the institutions of control. In Teklum, the maintenance of control was formerly centered in the guardianship against malevolent spirits held by the ancestor spirits and the curers. The "police force," made up of ten

leaders, both in the civil authority and in the curing profession. The transition from the old hierarchy of control to the new leadership structure is still in process. In the most recent confrontation of the civil authority and curers, the fact that neither side resorted to violence suggests the transitional nature of homicide as a solution in intracommunal conflict.

This study of homicide indicates that the changing rate of behavior points to structural change, but does not in itself indicate what kind of change occurs or from what motives it stems. Qualitative case analysis related to structural changes within the recall of informants is essential for understanding social process.

NOTES

[1] Field work is based on two periods of residence in the community in 1964 and 1965; it was supported by the National Institute of Mental Health. I am grateful for comments by Paul Friedrich, Richard Henderson, Harold Scheffler, and Peter Wilson, who have improved the original version read at the 1965 meetings of the American Anthropological Association. I remain responsible for the contents of the paper.

[2] Henry and Short (1954:18) analyze both suicide and homicide as undifferentiated aggressive reactions to frustration, the rates of which vary—in the first case inversely and in the second case directly—with the strength of the external control system over behavior. Their assumption that homicide is motivationally a single phenomenon, and not an expression of a variety of motives, stems from the assumption that all cases of aggressive acts are the result of frustration. Straus and Straus (1964:587) apply a similar correlational analysis of homicide and suicide rates with structural features of society in Ceylon, but come to opposite conclusions. They maintain that one would expect greater evidence of homicide in a "loosely structured society," by which they mean one with considerable sanctioning of variation in individual behavior. These studies contradict each other in the conclusions that they reach by similar analytical processes, but they are attempts to move away from such psychoanalytic reasoning as the death-wish theory.

[3] Bohannan's (1960) survey of homicide and suicide in African societies represents a useful model for comparing the total pattern of homicide cross-culturally. In presenting the case material here, I have used a similar format, adding to it the circumstances surrounding the killing. In the analysis of these materials, I have diverged from Bohannan's model in trying to demonstrate the linkage among the components—the ratios, to use Burke's (1945) terminology of scene/setting/actor/agent.

[4] The term "witch" is a translation of the Tzeltal term *Pah'-Xamal*, literally "giver of sickness." The term "curer" is a translation of *Pa'Pal*. The power to cure and to give sickness stems from the possession of a *rnayohel*, or animal spirit.

[5] For a discussion of the tactics of gaining consensus in witch-killings, see Manning Nash (1960).

[6] Political homicide by agrarian leaders, which is so frequent in the central plateau (Friedrich 1962), is a relatively recent phenomenon in the retreat zones of Indian population. The cases analyzed by Friedrich are a strategy of political power stemming from a revolutionary background, and the cultural assumptions to which he points contrast with those underlying witch-killings. My only comparable case is, significantly, found outside the traditional center, in the new ejido colony.

[7] Jules Henry (1936) sees the formula of fear and anger as the
